

Getting Products to People

Investing in commodities will improve maternal, neonatal and child health in Nigeria

In Nigeria, commodities required to meet the needs of the population & achieve the MDG 4 and 5 targets are estimated to cost a total of approximately **\$859 million annually**. There is a gap between resources committed and resources required to meet maternal, neonatal and child health commodity needs.

Allocating resources to cover that gap can mean the difference between a life saved or lost, more than a million times over.

Commodities are

essential medicines, vaccines, and supplies, for family planning, HIV/AIDS, malaria, nutrition, and TB

Through 2015, if resource needs are met to supply the necessary MNCH commodities to providers, nearly 2 million additional lives can be saved, including:

274,856

maternal lives saved

475,072

newborn lives saved

1,139,816

child lives saved
