

HEALTH SUPPLY CHAIN MANAGEMENT:

JSI's approach to strengthening and scaling consumer-centric supply chains

JSI is committed to ensuring that people have on-demand access to high-quality, affordable health supplies where, when, and how they want to receive them.

Strong supply chains save lives. JSI strives to improve the health and well-being of people around the world through equitable access to medicines and health commodities.

We do this by:

Transforming health supply chains powered by data

We design and deploy digital solutions to improve supply chain performance and accountability. Our support spans the value chain, from the national level where our investments in traceability provide up-to-the-minute visibility of health products, to the community level, where we work with health workers to co-design community health resupply systems that improve product availability.

Developing and shaping a healthy marketplace

We work with and leverage the comparative advantage of all sectors—public, commercial, and nonprofit—to promote healthy markets, increase access and equity, and improve efficiency. We forge partnerships to bring new and underused health products to market, including vaccines and HIV, family planning, and child health products. With counterparts, we design and strengthen supply chains for these products and unlock the hurdles to regulatory approval and financing.

At JSI, we believe access to healthcare is a right and not a privilege and that patients and consumers deserve on-demand access to quality health supplies where, when, and how they want to receive them at a price they can afford."

- Edward Wilson, Director, Center for Health Logistics, JSI

Strong supply chains save lives.

Connecting supply and demand

Strong supply chains are the backbone of health systems and are essential to positive health outcomes. We work at the intersection of supply and demand to bolster service delivery and program performance. Our support spans HIV, reproductive health, malaria, maternal health, pandemic response, and neglected tropical diseases, operating along the continuum from acute and fragile settings to more stable contexts.

Localizing sustainable and high-performing health supply chains

In trusted partnership with country counterparts, JSI supports a pathway to a vibrant and sustainable local supply chain ecosystem by developing appropriate solutions, building local partnerships, and uplifting local service providers and supply chain professionals. We work with governments to strengthen leadership and oversight of national public health supply chains that leverage the talent and competencies of both the public and private sectors, while unlocking the barriers that private actors face in entering the market.

Solving tomorrow's health supply chains challenges

With a rapidly changing political, economic, and public health landscape, we help our customers build resilient and responsive supply chains that can mitigate today's health challenges, while offering new supply chain solutions to meet tomorrow's health priorities.

Our team

JSI's supply chain team has expertise across all sectors and levels of the health system – from global procurement and managing supplier contracts to in-country supply and delivery systems.
