

PUBLIC HEALTH SUPPLY CHAIN MANAGEMENT

Strong supply chains save lives. The JSI health logistics practice draws inspiration from this motto because we are committed to improving the lives of people and communities worldwide.

Global and local partners and governments depend on us to get the right amount of medicines, vaccines, and other health products and supplies to the people who need them, when they need them, no matter where they live. With more than 30 years of experience building sustainable supply chain systems in more than 60 countries, JSI is the world leader in health supply chain management. We've regularly created new ways to make supply chains more effective and efficient and we're proud others readily adopt our innovations.

Through trusted relationships with country and local governments, we help countries scale up and manage their own sustainable supply chains. This includes establishing logistics management units, building pre-service training programs, and training more than 150,000 staff at all levels to build capacity at every step in the supply chain, from procurement, warehousing, and distribution networks to covering the last mile to reach health clinics and patients.

As a private company with a public health mission, we adapt commercial-sector tools and approaches to strengthen public health supply chains. We provide our customers with an end-to-end view of supply chains, minimizing waste and increasing efficiency.

As the world aims to meet global health goals, JSI is leading the way in making supply chains resilient enough to tackle health threats and embrace emerging trends to improve the health of millions.

STRONG SUPPLY CHAINS SAVE LIVES

JSI and our partners are saving and improving millions of lives by helping to:

- Eliminate malaria
- Improve maternal and child health
- Increase access to contraceptives
- Increase routine immunization rates
- Eliminate TB, polio, HIV, and other infectious diseases
- Respond to health emergencies
- Anticipate and preparing for emerging health trends

We apply commercial-sector best practices and new technologies to our specific areas of work:

- Supply chain analysis (including network, cost, and performance)
- Supply chain design and implementation
- Information system development, deployment, and support
- Data analysis and use
- Forecasting and supply planning
- Capacity building
- Private-sector service provider engagement
- Supply chain policy and strategy
- Financing and resource mobilization
